Quadric surfaces: Cone, Cylinder

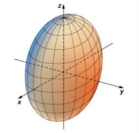
Case studies of 2nd order curve equation (ENG)

Ellipsoid

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}+\frac{z^2}{c^2}=1$$

Traces
In plane $z = p$: an ellipse
In plane $y = q$: an ellipse
In plane $x = r$: an ellipse

If $a = b = c$, then this surface is a sphere.

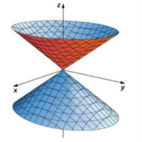


Elliptic Cone

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}-\frac{z^2}{c^2}=0$$

Traces
In plane $z = p$: an ellipse
In plane $y = q$: a hyperbola
In plane $x = r$: a hyperbola
In the xz – plane: a pair of lines that intersect at the origin
In the yz – plane: a pair of lines that intersect at the origin

The axis of the surface corresponds to the variable with a negative coefficient. The traces in the coordinate planes parallel to the axis are intersecting lines.

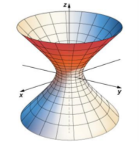


Hyperboloid of One Sheet

$$\frac{x^2}{a^2}+\frac{y^2}{b^2}-\frac{z^2}{c^2}=1$$

Traces
In plane $z = p$: an ellipse
In plane $y = q$: a hyperbola
In plane $x = r$: a hyperbola

In the equation for this surface, two of the variables have positive coefficients and one has a negative coefficient. The axis of the surface corresponds to the variable with the negative coefficient.

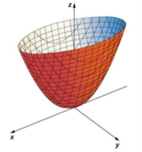


Elliptic Paraboloid

$$z=\frac{x^2}{a^2}+\frac{y^2}{b^2}$$

Traces
In plane $z = p$: an ellipse
In plane $y = q$: a parabola
In plane $x = r$: a parabola

The axis of the surface corresponds to the linear variable.

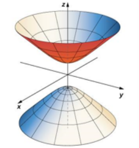


Hyperboloid of Two Sheets

$$\frac{z^2}{c^2}-\frac{x^2}{a^2}-\frac{y^2}{b^2}=1$$

Traces
In plane $z = p$: an ellipse or the empty set (no trace)
In plane $y = q$: a hyperbola
In plane $x = r$: a hyperbola

In the equation for this surface, two of the variables have negative coefficients and one has a positive coefficient. The axis of the surface corresponds to the variable with a positive coefficient. The surface does not intersect the coordinate plane perpendicular to the axis.



Hyperbolic Paraboloid

$$z=\frac{x^2}{a^2}-\frac{y^2}{b^2}$$

Traces
In plane $z = p$: a hyperbola
In plane $y = q$: a parabola
In plane $x = r$: a parabola

The axis of the surface corresponds to the linear variable.

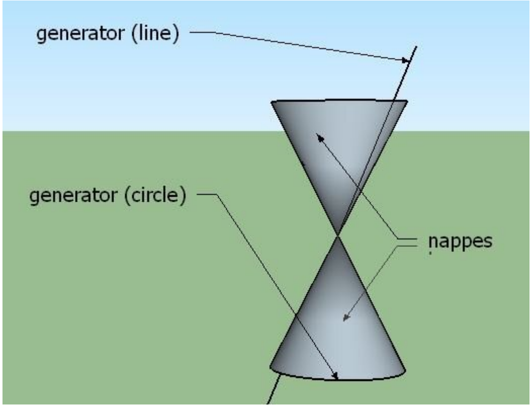
Generator

Definition

A line all points of which lie on a quadric is called **a generator of the quadric**. An elliptic cone is a quadric surface which is generated by a straight line which passes through a fixed point and which intersect an ellipse. Then, the equation of generator is:

$$\frac{x - x_v}{l} = \frac{y - y_v}{m} = \frac{z - z_v}{n}$$



Task 1

Find the equation of the cone with its vertex at $(1, 1, 1)$ and which passes through the curve $x^2 + y^2 = 4, z = 2$.

Task 1

Answer

Let's find a generator of the cone, when $V(1, 1, 1)$. Also, let's consider that our line intersects the plane $z = 2$:

$$\frac{x-1}{l} = \frac{y-1}{m} = \frac{1}{n}, \Rightarrow x = \frac{l}{n} + 1,\ y = \frac{m}{n} + 1 \qquad (1)$$

This point lies on the curve $x^2 + y^2 = 4$, hence – put (1) into the circle

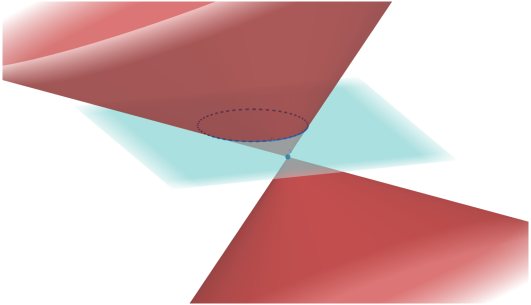
$$\left(\frac{l}{n} + 1\right)^2 + \left(\frac{m}{n} + 1\right)^2 = 4 \qquad (2)$$

Our goal to eliminate $l,\ m,\ n$ from equation above.

$$\frac{l}{n} = \frac{x-1}{z-1},\ \frac{m}{n} = \frac{y-1}{z-1} \rightarrow (2)$$

$$\left(\frac{x-1}{z-1} + 1\right)^2 + \left(\frac{y-1}{z-1} + 1\right)^2 = 4 \text{ after simplification} \Rightarrow$$

$$\Rightarrow x^2 + y^2 - 2z^2 + 2xz + 2yz - 4x - 4y + 4 = 0$$



Task 2

Find the equation of the cone with its vertex at the origin, which passes through the curve $ax^2 + by^2 + cz^2 - 1 = 0 = \alpha x^2 - \beta y^2 - 2z$.

Task 2

Answer

This task is an upgraded version on the 1-st task.
Right now, we don't know neither the center of a given curve, nor the conic section passed through the center. Let's find it

$$ax^2 + by^2 + cz^2 - 1 - \alpha x^2 + \beta y^2 + 2z = 0 \Rightarrow$$

$$\Rightarrow (a-\alpha)x^2 + (b+\beta)y^2 + (z + \frac{1}{c})^2 = \frac{c+1}{c}$$

The center of the curve is $(0,\ 0,\ = -\frac{1}{c})$. Let's find a conic section in a plane, paralel to z axis (just simplificaton, can choose any).

$$(a-\alpha)x^2 + (b+\beta)y^2 = \frac{c+1}{c} \qquad (3)$$

Now, the task is the same as the first one. We know the vertex (origin) and a curve, which should be passed through.

$$\frac{x-0}{l} = \frac{y-0}{m} = \frac{-\frac{1}{c}-0}{n}, \Rightarrow x = -\frac{l}{cn},\ y = -\frac{m}{cn}$$

Put $x,\ y$ into (3):

$$(a-\alpha)\frac{l^2}{c^2n^2} + (b+\beta)\frac{m^2}{c^2n^2} = \frac{c+1}{c} \qquad (4)$$

Based on equation of generator we will receive $\frac{l}{n} = \frac{x}{z};\ \frac{m}{n} = \frac{y}{z}$. Put it into (4)

$$(a-\alpha)\frac{x^2}{z^2} + (b+\beta)\frac{y^2}{z^2} = c^2 + c \Rightarrow$$

$$(a-\alpha)x^2 + (b+\beta)y^2 - (c^2+c)z^2 = 0$$

Task 3

Find the equation of the cone, which passes through the axes.

Task 3

Answer

The cone passes through the axes. Therefore, the vertex of the cone is the origin.

The equations of the cone is a homogeneous equation of second degree in *x*, *y* and *z*.

$$\text{(i.e.)} \quad ax^2 + by^2 + cz^2 + 2fyz + 2gzx + 2hxy = 0 \qquad (15.25)$$

Given that *x*-axis is a generator.

Then $y = 0$, $z = 0$ must satisfy the equation (15.25)

$$\therefore a = 0$$

Since *y*-axis is a generator $b = 0$.

Since *z*-axis is a generator $c = 0$.

Hence the equation of the cone is $fyz + gzx + hxy = 0$.

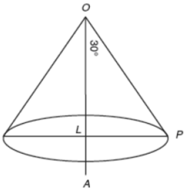
Task 4

Find the equation of the right circular cone whose vertex is at the origin, whose axis is the line $\frac{x}{1} = \frac{y}{2} = \frac{z}{3}$ and which has a vertical angle of $60°$.

Task 4

Answer

The axis of the cone is $\frac{x}{1}=\frac{y}{2}=\frac{z}{3}$.



Therefore, the direction ratios of the axis of the cone are 1, 2, 3.

The direction cosines are $\frac{1}{\sqrt{14}},\frac{2}{\sqrt{14}},\frac{3}{\sqrt{14}}$.

Let $P(x, y, z)$ be any point on the surface of the cone.
Let PL be perpendicular to OA.

$$\angle POL = 30°$$

$$\frac{OL}{OP} = \cos 30° \text{ or } 2OL = \sqrt{3}OP$$

Also, $$OP^2 = x^2 + y^2 + z^2$$

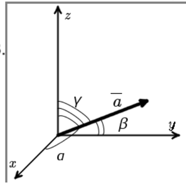
$$OL = \text{Projection of } OP \text{ on } OA$$

$$= \frac{x}{\sqrt{14}} + y\times\frac{2}{\sqrt{14}} + z\times\frac{3}{\sqrt{14}} = \frac{x+2y+3z}{\sqrt{14}}$$

$$\therefore \frac{2(x+2y+3z)}{\sqrt{14}} = \sqrt{3}\sqrt{x^2+y^2+z^2}$$

$$4(x+2y+3z)^2 = 42(x^2+y^2+z^2)$$

or $$19x^2+13y^2+3z^2-8xy-24yz-12zx=0$$



The **direction cosines** of the vector a are the cosines of angles that the vector forms with the coordinate axes.

$$\cos\alpha = \frac{a_x}{|\bar{a}|};\quad \cos\beta = \frac{a_y}{|\bar{a}|};\quad \cos\gamma = \frac{a_z}{|\bar{a}|}$$

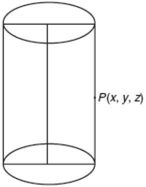
$$\cos^2\alpha + \cos^2\beta + \cos^2\gamma = 1$$

Task 5

Find the equation of the cylinder whose generators are parallel to the line $\frac{x}{-1} = \frac{y}{2} = \frac{z}{3}$ and whose directional curve is $x^2 + y^2 = 9, z = 1$.

Task 5

Answer



The equations of the generator through *P* and parallel to the line

$\frac{x}{-1}=\frac{y}{2}=\frac{z}{3}$ are $\frac{x-x_1}{-1}=\frac{y-y_1}{2}=\frac{z-z_1}{3}$ (16.8)

The guiding curve is $x^2+y^2=9, z=1$ (16.9)

When the generator through *P* meets the guiding curve,

$$\frac{x-x_1}{-1}=\frac{y-y_1}{2}=\frac{z-z_1}{3}$$

$$\therefore x = x_1-\frac{1-z_1}{3}=\frac{3x_1+z_1-1}{3}, y = y_1+\frac{2(1-z_1)}{3}=\frac{3y_1-2z_1+2}{3}$$

Since this point lies on the curve (16.9),

$$(3x_1+z_1-1)^2+(3y_1-2z_1+2)^2=81$$

The locus of (x_1, y_1, z_1) is $(3x+z-1)^2+(3y-2z+2)^2=81$

(i.e.) $9x^2+9y^2+5z^2+6xz-12yz-6x+12y-10z-76=0$

This is the equation of the required cylinder.

Task 6

Find the equations of the right circular cylinder of radius 3 with equations of axis as

$$\frac{x-1}{2}=\frac{y-3}{2}=\frac{z-5}{-1}.$$

Task 6

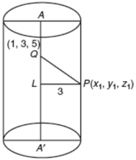
Answer

The equations of the axis are

$$\frac{x-1}{2}=\frac{y-3}{2}=\frac{z-5}{-1}$$

(1, 3, 5) is a point on the axis.
2, 2, –1 are the direction ratios of the axis.

$\therefore$ direction cosines are $\frac{2}{3},\frac{2}{3},\frac{-1}{3}$



Let $P\,(x_1, y_1, z_1)$ be any point on the cylinder.

$$\begin{aligned} QL &= \text{Projection of } PQ \text{ on the axis} \\ &= (x-x_1)l+(y-y_1)m+(z-z_1)n \\ &= (x_1-1)\frac{2}{3}+(y_1-3)\frac{2}{3}-(z_1-5)\frac{1}{3} \\ &= \frac{2x_1+2y_1-z_1-3}{3} \end{aligned}$$

Also, $PQ^2 = QL^2 + LP^2$

$$\text{(i.e.)}\quad (x_1-1)^2+(y_1-3)^2+(z_1-5)^2=\left(\frac{2x_1+2y_1-z_1-3}{3}\right)^2+9$$

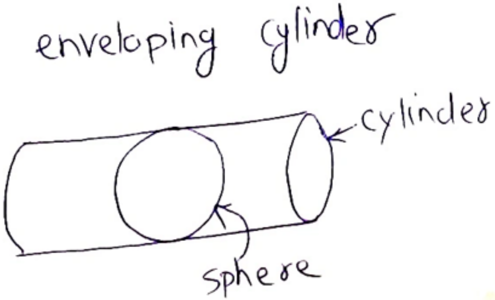
The locus of (x_1, y_1, z_1) is

$$\begin{aligned} &9(x^2-2x+1+y^2-6y+9+z^2-10z+25) \\ &\quad =4x^2+4y^2+z^2+9+8xy-4xz-12x-4yz-12y+6z+81 \\ \text{(i.e.)}\quad &5x^2+5y^2+8z^2-8xy+4xz+4yz-6x-42y-96z+225=0 \end{aligned}$$

This is the equation of the required cylinder.

Task 7

Find the equation of the enveloping cylinder of the sphere $x^2 + y^2 + z^2 - 2x + 4y = 1$ having its generators parallel to the line $x = y = z$.



Task 7

Answer

Let $P(x_1,\ y_1,\ z_1)$ be any point on a tangent, which is parallel to the line $x = y = z$.

Hence, the equation of the tangent lines are

$$\frac{x - x_1}{1} = \frac{y - y_1}{1} = \frac{z - z_1}{1} \qquad (5)$$

Any point on this line is $(x_1 + \tau,\ y_1 + \tau,\ z_1 + \tau)$. This point lies in this sphere.

$$x^2 + y^2 + z^2 - 2x + 4y - 1 = 0 \qquad (6)$$

$$(x_1 + \tau)^2 + (y_1 + \tau)^2 + (z_1 + \tau)^2 - 2(x_1 + \tau) + 4(y_1 + \tau) - 1 = 0 \Rightarrow$$

$$\Rightarrow 3\tau^2 + 2\tau(x_1 + y_1 + z_1 + 1) + (x_1^2 + y_1^2 + z_1^2 - 2x_1 + 4y_1 - 1) = 0$$

If (5) touches (6), τ is unique ($\mathscr{D} = 0$).

$$\mathscr{D} = 4(x_1 + y_1 + z_1 + 1)^2 - 12(x_1^2 + y_1^2 + z_1^2 - 2x_1 + 4y_1 - 1) = 0 \quad (7)$$

Solving (7) and change P to general form, we are obtaining the answer

$$x^2 + y^2 + 5y + z^2 - 4x - z - xy - xz - yz - 2 = 0$$
